Excellent electronic book and helpful one. Better then never, though i am quite late in start reading this one. You wont truly feel monotony at whenever you want of your time (that's what catalogues are for relating to when you question me).

Excerpt: .coefficient, 1: the number of poles, 21 the number of stator slots per pole per phase, d the diam. of rotor in cm., A the air-gap depth, and 1 denotes the length of iron axially (core length). Tabulated values of the coefficient K1 and K, are given for various conditions. 778. Graphical Treatment of the Rotating Field. R. E. Hellrund. (Amer. Inst. Elect. Engin., Proc. 27. pp. 927-948, June, 1908.)--- The author first describes Gorges diagram for the flux in the teeth of the rotor. The space values of the magnetic flux density for the case of a two-phase winding with four slots per pole per phase are shown graphically. The time values of the quantities are then developed, and a comparison is made with the results obtained on the ordinary theory. The diagrams show that the max. values of the flux in individual teeth vary in magnitude, and that the time values are different from those obtained by merely considering the distances between the teeth. They also show that the total field rotates with varying speed. The author develops a method of taking the reactive effect of the secondary circuit into account, and for this purpose he finds it convenient to define the ratio of the magnetising current of a motor with short-circuited and synchronously revolving rotor to the current when the rotor windings are on open circuit, as the reactance factor of the motor. Field diagrams for a three-phase motor with three slots...
